ServiceNow Hackathon for College Students

Problem Statements

Smart Urban Corporation Management

One centralized, AI-powered platform for reliable citizen services

Water · Power · Roads

Background

Urban residents face daily shortfalls in clean water, uninterrupted power and safe road infrastructure — outages, potholes, congestion and water logging affect millions, cutting productivity and raising living costs.

Existing systems cannot monitor, predict or respond to rising demand. Without real-time visibility and citizen engagement, cities cannot deliver sustainable, equitable access to basic necessities.

Objectives

- Reliable access to clean water, power and safe roads for every resident
- Smart, data-driven monitoring to detect issues early and optimize distribution
- Better quality of life: fewer disruptions, faster civic issue resolution

The Solution — A Centralized AI-Powered Civic Platform

AI Core

Predictive analytics forecast demand, failures and outages before they hit citizens.

IoT & Real-Time Sensing

Sensors on water, grid and road networks stream live health and usage data.

Citizen Mobile App

One-tap reporting, outage alerts and transparent status tracking for residents.

Unified Service Ops

Connected dashboards route crews, prioritize repairs and cut resolution time.

Reliable service delivery · Faster issue resolution · Sustainable, equitable cities

Multi-Vendor SLA Ownership & First Assignment Tracking

Incident Management | ServiceNow solution design for accurate SLA accountability across MSPs

TCS · PwC · Infinite · Partner MSPs

BUSINESS CONTEXT

- Enterprises run incidents across multiple MSP-managed assignment groups
- Traditional SLAs use current ownership only — no vendor-level history
- First-touch time, per-vendor SLA consumption and breach attribution are invisible
- Vendor performance and fair accountability cannot be measured

OBJECTIVE

- Capture first assignment timestamp per MSP
- Maintain vendor-specific SLA ownership through the lifecycle
- Calculate SLA targets from vendor assignment history
- Expose incidents transferred between vendors
- Enable accurate vendor performance reporting

BUSINESS VALUE

Stronger multi-vendor governance, accurate SLA ownership and delivery accountability

KEY ELEMENTS / DESIGN CONSIDERATIONS

Custom Fields

- TCS / PwC / Infinite First Assigned
- Current MSP ownership field

Business Rules

- Capture first assignment timestamp
- Preserve original value on reassignment
- Update current vendor ownership

Script Includes

- Vendor SLA Support framework
- Dynamic vendor mapping via properties

SLA Management

- Retroactive Start configuration
- Vendor Response & Resolution SLAs
- Re-evaluation on assignment change

Flow Designer (optional)

- Vendor transition notifications
- SLA ownership updates

System Properties

- Vendor-to-field mapping config
- Onboard new MSPs without code change

Reporting & Dashboards (optional) — Vendor SLA compliance dashboard · Breach analysis by MSP · Vendor performance scorecards

EXPECTED OUTCOME

Automatic first-assignment tracking · SLA accuracy despite group transfers · Vendor-specific reporting & breach analysis · Less manual SLA effort · Clear management visibility

AI-Driven Digital Gold Buying & Investment Platform

SOLUTION BLUEPRINT

Financial Services / FinTech • ServiceNow as the orchestration layer across customers, gold providers, banks, payments & compliance

BACKGROUND Customers prefer digital gold for convenience, security and fractional ownership, but platforms lack transparency, personalised advice, easy KYC, portfolio visibility and support — while firms struggle with onboarding, transactions, partner APIs, compliance and redemption.

OBJECTIVE Build an AI-powered digital gold platform on ServiceNow where customers buy, sell, redeem and track gold via certified partners (SafeGold, MMTC-PAMP, Augmont), with intelligent investment recommendations, automated compliance and superior customer experience.

ELEMENTS TO INCLUDE IN THE DESIGN

Digital Gold Portal & App

- KYC onboarding, live gold prices
- Buy, sell, SIP scheduling
- Portfolio, certificates, beneficiaries
- Service Portal • Mobile • Catalog • KB

AI Investment Advisor

- Market trends & plan recommendations
- SIP sizing, goal tracking
- Regulatory guidance, txn Q&A
- Virtual Agent • AI Agent Studio • Gen AI

Gold Partner Integration Hub

- Real-time pricing, buy/sell APIs
- Wallet & transaction sync
- SafeGold • Augmont • MMTC-PAMP
- IntegrationHub • REST • MID • Flow

Onboarding & KYC

- PAN, Aadhaar, CKYC validation
- Address check, risk scoring, AML
- App Engine • Document Intelligence
- Workflow Designer • IntegrationHub

Gold Wallet & Portfolio

- Holdings and valuation
- Real-time market value, returns
- SIP investments, redemption tracking
- App Engine • Dashboards • Analytics

Buy / Sell Workflows

- Live rate → amount → quantity → pay
- Price lock, payment validation
- Partner confirmation, wallet update
- Settlement, tax docs, certificates

Redemption Management

- Coin, bar and weight selection
- Delivery address validation
- Shipping & status monitoring
- Notification delivery

Customer Support Hub

- Failed transactions & disputes
- Certificate and KYC escalations
- Redemption request handling
- CSM • Case Mgmt • Agent Workspace

AI Engine & Prediction

- Risk profile, history, goals analysis
- Portfolio balancing & goal planning
- Wealth growth and SIP forecasting
- Predictive Intelligence

Alerts & Dashboards

- Price drop/surge, SIP due, targets
- Investment & operations dashboards
- Customer and risk/compliance views
- Performance Analytics • Notifications

ServiceNow modules: App Engine • Service Portal • Mobile App Builder • Flow Designer • IntegrationHub • Virtual Agent • AI Agent Studio • Predictive Intelligence • CSM • Financial Services Operations • Performance Analytics • Document Intelligence • Knowledge Management • Notifications • REST APIs

BUSINESS BENEFITS

- ▸ Gold buying in minutes
- ▸ End-to-end automated journey
- ▸ Real-time gold pricing
- ▸ 24x7 self-service platform
- ▸ Reduced operational cost
- ▸ Stronger regulatory compliance
- ▸ AI-driven recommendations
- ▸ Superior customer experience
- ▸ Partner ecosystem integration
- ▸ Scalable wealth platform

Potential use case: ServiceNow + SafeGold / Augmont platform — customers invest in digital gold from a ServiceNow-powered financial services portal, with AI handling advisory, service, compliance and portfolio management.

AI-Driven Employee Onboarding & Workplace Readiness Orchestration

A ServiceNow-based platform for unified, role-based onboarding across HR, IT, Facilities, Security and Finance

BACKGROUND

- Hundreds of hires across business units, locations and roles
- Coordination runs on email, spreadsheets and disconnected systems
- Delays in laptops, access, workspace, ID cards and training cost productive first days

OBJECTIVE

- One onboarding experience with auto-generated, role-based tasks
- Cross-department coordination and readiness tracking
- AI flags likely delays before the joining date

ELEMENTS TO INCLUDE IN DESIGN

Employee Center
Personalized onboarding workspace

HR Service Delivery
Onboarding case management

Service Catalog
Role/location-based requests

Flow Designer
Automated cross-functional workflows

Integration Hub
Identity, IT and facilities systems

Task Management
Auto assignment and SLA tracking

Knowledge Management
Role-specific onboarding info

Performance Analytics
Onboarding readiness dashboard

Generative AI
Status summaries, pending actions

Virtual Agent
Answers employee onboarding questions

EXPECTED OUTCOME Unified onboarding that improves day-one readiness, cuts manual coordination, gives HR and managers real-time visibility, and minimizes delays in access, equipment and workplace setup.

Intelligent Major Incident Command
& Business Impact Management

AI + ServiceNow

BACKGROUND

Major IT incidents disrupt thousands of employees and critical operations. Information is scattered across incident records, email, collaboration channels, monitoring tools and manual status updates — forcing managers to spend their time collecting data instead of resolving.

OBJECTIVE

Build an AI-enabled ServiceNow major incident command platform that consolidates incident information, coordinates technical teams, identifies affected business services, automates stakeholder communications, and delivers AI-generated summaries and next-action recommendations.

PLATFORM DESIGN ELEMENTS

01 **Incident Management**
Major incident lifecycle

02 **CMDB / Service Mapping**
Business service impact identification

03 **Major Incident Management**
Incident command and coordination

04 **Flow Designer**
Automated escalation & communication

05 **Workplace / Collaboration**
Centralized incident collaboration

06 **Business Rules**
Automated severity & escalation logic

07 **Performance Analytics**
MTTR, trends and business impact

08 **Knowledge Management**
Recommended resolution knowledge

09 **Generative AI**
Summaries & stakeholder updates

10 **Virtual Agent**
Employee incident status and FAQs

EXPECTED OUTCOME

Faster incident coordination • Improved visibility into business impact • Reduced manual effort • Consistent command-center experience

Automated IT Service Outage Communication & User Impact Management

A ServiceNow platform that detects impact, coordinates communications, and keeps employees informed in real time

BACKGROUND

During disruptions, teams hold conflicting information about affected applications, resolution times, and business impact. Service desks face call spikes while manually drafting updates, and employees keep calling for lack of reliable status.

OBJECTIVE

Automatically identify affected users and services, trigger coordinated communication workflows, publish real-time outage status, and use AI to generate audience-specific updates for technical and business readers.

PLATFORM DESIGN ELEMENTS

Incident Management
Outage and incident tracking

CMDB / Service Mapping
Affected services and dependencies

Service Status / Employee Center
User-facing service status

Flow Designer
Automated communication workflows

Notification Framework
Targeted stakeholder communication

Business Rules
Communication triggers and escalation

Performance Analytics
Outage frequency and business impact

Knowledge Management
Self-service outage information

Generative AI
Concise technical and business updates

Virtual Agent
Answers questions on active outages

EXPECTED OUTCOME

Faster, more consistent outage communication • Fewer duplicate service desk contacts • Greater employee visibility • Stronger IT–business coordination

Predictive SLA Breach Prevention & IT Service Recovery

A ServiceNow solution that predicts SLA risk and triggers intervention before the breach

Background

IT teams handle thousands of incidents against varied SLA targets. Breaches surface only near the deadline, and manual monitoring hides bottlenecks, aging tickets and assignment delays.

Objective

Continuously evaluate active tickets, flag those at risk of breach, determine contributing factors, and automatically trigger the right escalation or reassignment.

Design Elements

- **Incident & Request Mgmt** — SLA-based ticket lifecycle
- **SLA / Task SLA** — Track contractual targets
- **Flow Designer** — Automated breach-prevention flows
- **Assignment Rules** — Reassign by workload and skills
- **Business Rules** — Risk and escalation conditions
- **Performance Analytics** — SLA compliance, bottleneck analysis
- **Custom Tables** — Risk factors, intervention history
- **Notifications** — Proactive stakeholder & resolver alerts
- **Generative AI** — Explain reasons for potential breach
- **Predictive Intelligence** — Identify tickets likely to breach

Expected Outcome

- Earlier detection of at-risk tickets
- Intervention before breach
- Higher SLA compliance
- Visibility into recurring bottlenecks

Smart CI Onboarding & Governance Framework

A ServiceNow solution for guided CI intake, validation, approval, and automated CMDB record creation

BACKGROUND

New applications, servers, and databases are added constantly, yet CIs are still created manually in the CMDB — causing missing information, inconsistent data, and delays.

OBJECTIVE

Let users onboard new CIs through a single guided form, then create CMDB records automatically once validation and approval are complete.

SOLUTION DESIGN ELEMENTS

- **Service Catalog**
- **CMDB Tables**
- **Flow Designer**
- **Approval Workflow**
- **Notifications**
- **Business Rules**
- **Dashboards & Reports**

EXPECTED OUTCOMES

- Faster CI onboarding
- Standardized CMDB data
- Improved data quality
- Reduced manual effort
- Visibility into requests
- Traceable approvals

BUSINESS VALUE

Accurate, consistent CMDB data with significantly less time required to onboard new IT assets and services.

Automated Assignment Group Deactivation Impact Assessment & Dependency Analyzer

ServiceNow solution concept | End-to-end dependency scan, risk classification and remediation guidance before a group is deactivated

BUSINESS CONTEXT

Assignment Groups are retired, consolidated or decommissioned during application sunset, org restructuring, vendor transitions and support-model changes. Today administrators verify dependencies manually across incidents, changes, CMDB, business applications, service mappings, catalog items, assignment rules, notifications, workflows and custom apps — slow, error-prone and prone to missed references.

Risk of blind deactivation: service disruption | workflow failures | incorrect task assignment | CMDB ownership gaps | operational outages

OBJECTIVE

Automatically perform an end-to-end impact assessment before an Assignment Group can be deactivated — dynamically identifying every reference to the selected group, evaluating operational and configuration dependencies, classifying risk and returning clear remediation guidance.

DEPENDENCY ASSESSMENT ENGINE — AUTOMATED SCAN SCOPE

USER INTERFACE

- Assignment Group selection screen
- Assessment dashboard
- Dependency summary view
- Executive report generation

OPERATIONAL

- Incidents
- Problems
- Change requests
- Request items (RITMs)
- Catalog tasks
- Generic tasks
- Group memberships

CMDB

- Business applications
- Business services
- Application services
- Configuration items
- Service mapping components
- Support & managed-by groups

PLATFORM

- Assignment & approval rules
- Workflows
- Flow Designer flows
- Notifications
- Scheduled jobs
- Custom applications

METADATA

- Dynamic dictionary scan (sys_dictionary)
- Custom tables
- Cross-application references

TECHNICAL COMPONENTS

- Script Includes
- Flow Designer
- UI Actions
- Business Rules
- GlideRecord APIs
- CMDB tables
- Performance Analytics
- Workspace dashboard
- Reporting framework

BONUS AI-generated impact summary | dependency heat map | one-click remediation | automated reassignment suggestions | deactivation approval workflow

EXPECTED OUTCOME — GROUP DEACTIVATION IMPACT ASSESSMENT REPORT

Group Name: Database

Dependencies identified

Task assignment references 52 Incidents 8 Changes 10
Group members 3 Business services 2 Business applications 1
Assignment rules 1 Child groups 3

Affected records

INC0010015 CHG0000077 TASK0020031
SNSVC00004659 APM0001386

RISK: HIGH

Status: NOT READY FOR DEACTIVATION

Recommended actions

- Reassign active records
- Review assignment rules & remove memberships
- Update CMDB ownership
- Re-run assessment

AI-Powered Cybersecurity Awareness & Employee Risk Reduction Platform

Human error remains a leading cause of security incidents — replace annual check-box training with continuous, personalized, measurable engagement.

BUSINESS CONTEXT

- Heavy tech investment, yet employees still fall to phishing, password compromise, social engineering and data leakage.
- Annual training delivers poor knowledge retention and compliance exposure.
- Programs lack personalization, engagement and continuous reinforcement.

OBJECTIVE

Build an AI-powered awareness platform that lifts engagement through gamification, personalized learning journeys (quizzes + phishing simulation results) and real-time guidance — with the AI model tuned on quiz completion scores — so organizations can measure awareness levels and cut human-related risk.

AI Learning Assistant

- Conversational virtual assistant
- Recommendations from performance history
- Context-aware best-practice guidance

Gamified Experience

- Quizzes, challenges, simulations
- Badges, points, leaderboards, rewards
- Maturity-based learning paths

Phishing & Threat Awareness

- Simulated phishing campaigns
- Scenario-based exercises
- Immediate feedback and coaching

Analytics & Reporting

- Engagement dashboards
- Individual & team scorecards
- Trends for high-risk user groups

ServiceNow Integration

- Training assignments & campaigns
- Performance tracking and reporting
- HR + SecOps process integration

Student Innovation

- GenAI/LLM assistants, Virtual Agent
- App Engine, gamification frameworks
- Predictive analytics, mobile-first UX

EXPECTED OUTCOME

- ↑ Higher participation in awareness programs
- ◎ Better knowledge retention via continuous engagement
- Reduced susceptibility to phishing & social engineering
- % Measurable awareness scores & training effectiveness
- ★ Stronger security culture, lower overall cyber risk

Continuous, personalized, measurable cybersecurity behavior change

Standardize Workflow in ServiceNow to Reduce Support Cost

One template workflow + a configurable matrix — driven by 1st-level support, not developers

BACKGROUND

- A dedicated workflow per catalog item — every minor change means editing that workflow.
- Higher support cost, more development effort, slower SLA and lower CSAT.
- Touching a live workflow for a routine support task is an avoidable risk.

OBJECTIVE

- Design a custom matrix plus one template workflow, amalgamated so behavior is data-driven.
- 1st-level support manages the matrix through a simple user interface.
- One workflow serves many catalogs — approvals and task assignment shift with the matrix.
- Run support projects with minimum developers and minimum risk.

DESIGN ELEMENTS

Workflow
Single reusable template

Table Customization
Custom matrix tables

Catalog Interface
Conditional user input

Server-side Scripts
Resolve approvers & owners

EXPECTED OUTCOME

A standalone platform application where the developer supplies conditional input once, and the workflow reads that input to set approvers and task owners dynamically from the user's catalog form entries.

Leave Management System

Custom ServiceNow application | Design Blueprint

BACKGROUND

ServiceNow has no out-of-the-box leave management capability. Product Owners lack visibility into team availability, making sprint planning and backup allocation unreliable.

OBJECTIVE

Build a custom Leave Management module that pulls leave records from a dedicated external application, surfaces them in a real-time ServiceNow dashboard, and triggers delegation automatically when a member is on leave.

DESIGN ELEMENTS

- **Table Customization**
- **REST Integration**
- **Data Visualization & Dashboard**
- **Scheduled Job**
- **Scripts**

EXPECTED OUTCOME

A ServiceNow application, “Leave Management”, with core modules:

1. Upcoming Applied Leaves
2. Leave Balance
3. Tentative Leaves

Plus a standard dashboard showing leaves for selected group members.

Automated delegation • Real-time visibility • Reliable sprint planning

Automated Resolution Prediction

Faster L1 incident resolution through AI-matched historical fixes

Background

Level 1 support teams face tight SLAs and limited domain knowledge. Significant time is lost researching knowledge articles to find a resolution, increasing delivery time even for simple requests and incidents.

Objective

A new prediction field in the incident management system. On submission, a script include matches similar historical incidents, retrieves the resolution applied earlier, and displays it — giving the L1 assignee an immediate view of how this incident type was handled before.

Elements Included in Design

- Table Customization
- Server-side Scripting
- AI Algorithm
- Now Assist
- Generative AI
- ACL

Expected Outcome

Backend logic and scripting scans existing records, extracts the most favorable resolution instruction, and auto-displays it on the incident form — visible only to assignment group members.

AI-Driven Vulnerability Prioritization & Remediation Advisor

Concept

Risk-based ranking beyond CVSS — transparent, explainable, ServiceNow-integrated

BACKGROUND

▸ Thousands of findings from Qualys, Tenable, Defender ranked mainly by CVSS.
▸ Severity alone ignores business criticality, exposure, exploitability, age and effort.
▸ Effort goes to low-risk items while true critical risk stays open.

OBJECTIVE

An intelligent engine that identifies, ranks and recommends remediation by actual business risk — with explainable reasoning analysts can trust.

INTEGRATION

ServiceNow Vulnerability Response — priorities and AI recommendations pushed into existing remediation workflows.

KEY ELEMENTS

- Vulnerability Severity Analysis
- Asset Criticality Assessment
- Business Impact Scoring
- Active Incident Correlation
- Vulnerability Aging Analysis
- AI Remediation Recommendations

EXPLAINABILITY EXAMPLE — V123 · CRITICAL

CVSS 8.8 · Asset Criticality High · Internet-Facing · Active Incident · Age 40 days · Business Impact High
"Critical because a high-severity flaw affects a business-critical internet-facing asset tied to an active incident and unresolved for 40 days."

EXPECTED OUTCOMES

▸ Faster remediation of business-critical vulnerabilities
▸ Higher prioritization accuracy based on real risk
▸ Greater trust through transparent AI decisions
▸ Better resource allocation for security teams
▸ Reduced cyber risk exposure
▸ Enhanced security-posture visibility
▸ Data-driven remediation planning

Smart CMDB Data Quality & Health Management Assistant

Continuous AI-driven analysis of CMDB records — detect issues, score health, recommend fixes

BACKGROUND / BUSINESS CONTEXT

A reliable CMDB underpins IT Operations, Change, Asset, Vulnerability and Incident management.

Organizations struggle with duplicate CIs, incomplete records, stale data and inconsistent relationships.

Poor data quality weakens decisions, raises operational risk and blocks automation.

OBJECTIVE

Develop an intelligent assistant that continuously analyzes CMDB records, identifies data quality issues, and recommends corrective actions.

KEY ELEMENTS / DESIGN CONSIDERATIONS

- Duplicate CI Detection
- Missing Attribute Identification
- Stale CI Discovery
- Relationship Validation
- Data Quality Scoring
- Automated Recommendations
- AI-based CI Classification
- ServiceNow CMDB Integration

EXPECTED OUTCOME

- Improved CMDB accuracy
- Fewer duplicate & stale records
- Greater confidence in operations
- Better incident, change & vulnerability management
- Higher CMDB health scores org-wide

AI-Powered Enterprise Service Desk Agent

Intelligent triage, knowledge, and resolution assistance built on ServiceNow

BUSINESS CONTEXT

Service desks handle high volumes of incidents across application access, password resets, software, devices, networks, and workplace technology.

Agents spend heavy manual effort reading descriptions, categorizing, searching for fixes, chasing missing details, and routing tickets.

Inconsistent ticket data and manual triage cause misassignment, repeated transfers, delayed resolution, and poor employee experience.

OBJECTIVE

Design an AI Service Desk Agent on ServiceNow that understands user-reported issues, collects relevant information, recommends solutions, and assists analysts across the ticket lifecycle.

Improve ticket quality and accelerate resolution while retaining human oversight for uncertain, sensitive, or high-impact decisions.

KEY DESIGN ELEMENTS

- Capture issues via portal, chatbot, or Virtual Agent
- Interpret unstructured user descriptions
- Ask contextual follow-up questions when details are missing
- Generate a concise incident summary
- Recommend category, subcategory, priority, assignment group
- Search and recommend relevant knowledge articles
- Detect duplicate or related incidents
- Suggest resolutions from previously resolved incidents

EXPECTED OUTCOMES

Faster registration & triage	Improved ticket data quality
Fewer incorrect assignments	Better knowledge article use
Higher first-contact resolution	Less manual agent effort

AI-Powered Major Incident Command Center

A single ServiceNow workspace for severity, mobilization, investigation, comms and recovery

ServiceNow | AI Assist

BUSINESS CONTEXT

Outages demand fast severity calls, impact analysis, team assembly, action tracking and stakeholder updates.
Context is scattered across monitoring tools, incident records, chats, emails and personal notes — delaying a common operational view and restoration.

OBJECTIVE

Unify incident context, stakeholder coordination, investigation, communications and recovery in one AI-powered command center.
Enables faster, better-informed decisions — with no high-risk action executed without human approval.

KEY ELEMENTS / DESIGN CONSIDERATIONS

- Qualify whether an incident is major
- Show affected services, apps, locations, users
- Identify technical teams via service ownership
- Create a structured virtual war room
- Continuously updated incident summary
- Chronological timeline of events & decisions
- Actions with owner, priority, status, due date
- Correlate alerts, changes, CIs, related incidents
- Recommend similar past incidents & resolutions
- Comms drafts: employees, customers, support, execs

EXPECTED OUTCOMES

- Faster mobilization of technical teams
- Improved visibility of incident status
- Consistent stakeholder communications
- Clear ownership of recovery actions
- Less duplicated investigation effort
- Better post-incident documentation

MEAN TIME TO RESTORE

Lower time to restore business service

Intelligent Cloud Cost Optimization Platform

ServiceNow-based governance for cloud waste reduction — visibility, prioritization, approval, and validated implementation

BUSINESS CONTEXT

Multi-cloud estates accumulate unused VMs, oversized infrastructure, unattached storage, dormant dev environments, and duplicate resources. Acting on them requires ownership validation, risk assessment, approval, scheduling, and evidence that business services were unaffected.

OBJECTIVE

Identify potential cloud waste, prioritize optimization opportunities, and manage the approval and implementation workflow end to end — balancing cost savings against service availability, security, performance, and business risk.

KEY DESIGN ELEMENTS

01 Ingest & Consolidate

- Import or simulate cloud asset, utilization, ownership and cost data
- Single consolidated view of resources across platforms and accounts

02 Detect & Quantify

- Flag idle, underutilized, oversized or duplicate resources
- Detect spend anomalies and estimate potential savings

03 Contextualize & Score

- Map resources to business applications and owners
- Assign risk and confidence levels to every recommendation

04 Approve & Implement

- Recommend resize, schedule, decommission or owner review
- Approval gate, implementation and validation tasks, rollback path, exclusions for critical or regulated services

EXPECTED OUTCOMES

- Improved visibility of cloud spend
- Controlled, approved implementation
- Clear ownership & accountability
- Auditable cost-saving actions
- Reduced avoidable infrastructure cost
- Finance–technical–service alignment

Automated Incident Classification, Assignment, Escalation & Notification

ServiceNow ITSM • Configurable Ticket-Routing & Notification Framework

Background & Objective

Background

- High incident volume lands on the Service Desk unclassified; agents manually set category, subcategory and assignment group.
- Manual triage delays resolver engagement, inflates MTTR and risks SLA breaches.
- Inconsistent assignment data weakens reporting and analytics.
- Stakeholders are not notified in time, especially on P1/P2 incidents.

Objective

- Configurable routing that auto-assigns incidents by category, subcategory and other ticket attributes.
- Reduce manual triage; improve assignment speed and accuracy.
- Notify assignment group members and the group manager.
- Hourly follow-up notifications for P1/P2 until resolved.
- Fallback routing when the group has no active members.
- Escalate when the group has no active manager.
- Extend later to Request Management and other task processes.

Design Considerations

- **Automated routing —** category/subcategory driven; extensible to business service, CI, location, impact, urgency, priority.
- **Loosely coupled logic —** rules maintained outside the incident flow — change routing without redesign.
- **Configurable matrix —** central attribute-to-group map with priority, active flag, effective dates and default fallback.
- **Group validation —** group must be active with at least one active member before assignment.
- **Fallback assignment —** no active members → auto-assign to Service Desk Tier 2.
- **Exception tagging —** tag NO_ACTIVE_GROUP_MEMBER / AUTO_ROUTING_FALLBACK; record original group and reason.
- **Dynamic notifications —** active members, group manager, Tier 2 on fallback, manager's manager when unavailable.
- **Manager validation —** verify active manager with valid email, else escalate to manager's manager or escalation owner.
- **Priority follow-up —** hourly reminders for P1/P2; stop automatically at Resolved or Closed.
- **Auditability & reuse —** log rule applied, groups, fallback reason, recipients, timestamps, escalations; reusable components.

Expected Outcomes

- **Less manual triage —** rule-based classification cuts Service Desk effort.
- **Faster assignment —** correct resolver group at creation; lower MTTA.
- **Higher accuracy —** standardised logic and a central matrix drive consistent decisions.
- **Lower MTTR, better SLA —** proactive routing and notifications reduce breach risk.
- **Validated groups —** only active, support-ready groups receive tickets.
- **Reliable fallback —** Tier 2 redirect prevents unassigned or stalled incidents.
- **Exception visibility —** tagged, audited fallbacks expose coverage gaps.
- **Timely notifications —** members and managers informed immediately; clear ownership.
- **Automated escalation —** missing management coverage escalates automatically.
- **Critical incident focus —** hourly P1/P2 reminders sustain engagement to resolution.
- **Full audit trail —** decisions, changes, recipients and timestamps captured for governance.
- **Analytics & scale —** consistent data for dashboards; reusable across Request, Catalog and Change.

Reusable routing, validation, notification and escalation components — a foundation for enterprise-wide ServiceNow automation.

AI-Powered Incident Communication Plan in ServiceNow with Now Assist

Hackathon Problem Statement | Scope: Priority 1, Priority 2 and Major Incidents

Problem Statement

- During P1/P2 and major incidents, stakeholder communication is still handled manually by incident managers.
- They gather updates from multiple teams, interpret technical work notes, rewrite them in business language and send them out.
- Result: delayed notifications, inconsistent or overly technical updates, conflicting messages and heavy repetitive effort.

Objective

- Build an intelligent incident communication framework in ServiceNow that creates, schedules and manages stakeholder updates.
- Use Now Assist to summarize incident details and work notes and generate business-friendly drafts per audience.
- Keep the incident manager in control: AI drafts, human approves, system publishes and records.

Solution Flow

1 Activate plan
P1 / P2 / Major incident

2 Summarize
Now Assist on work notes

3 Draft per audience
Tech · Business · Exec · Users

4 Review & approve
Incident manager sign-off

5 Publish & log
Channel delivery + audit trail

Core Capabilities to Build

- Auto-activation of the communication plan
- Audience detection from service, CI, priority, impact
- Now Assist summaries and audience-specific drafts
- Priority-based cadence: P1 30 min, P2 60 min
- Milestone triggers: workaround, restoration, resolution
- Final resolution summary after service restoration

Constraints

- Human-in-the-loop approval before any publication
- No PII, credentials or security detail in business comms
- Validate drafts for incident no., impact, status, next update
- Skip-duplicate logic when nothing has materially changed
- Separate templates for internal and external audiences

Expected Outcomes

- Faster, timely stakeholder communications
- Reduced manual effort for incident managers
- Consistent, standardized, audience-specific messaging
- Business-friendly translation of technical updates
- Improved incident transparency and stakeholder trust
- Complete audit trail and communication SLA adherence
- Concise, business-focused executive reporting
- Reusable for outages, degradation and security events

AI-Powered HR Case Triage, Resolution & Employee Support

Now Assist for HR Service Delivery | ServiceNow HRSD

01 Background

- Large volume of enquiries on payroll, benefits, leave, policies, onboarding, letters and personal data changes
- Requests arrive through email, chat, telephone and employee portals
- Manual review to identify service, sensitivity and owning HR team
- Results in delays, incorrect categorisation, repetitive enquiries and inconsistent responses
- Limited status visibility, risk of exposing confidential data and dependency on HR specialists
- HRSD centralises case management; Now Assist adds AI support for agents

02 Objectives

- Automatically understand, classify, prioritise and route employee enquiries
- Summarise cases and previous interactions for HR agents
- Recommend HR service, category, assignment group and priority
- Generate personalised response drafts and consistent resolution notes
- Surface relevant knowledge articles and suggested resolution steps
- Detect sensitive content and retain human review for high-impact decisions
- Improve self-service through intelligent search and Virtual Agent

03 Key Elements

- Omnichannel case creation via Employee Center, Virtual Agent, email, mobile and phone
- AI-assisted classification of service, topic, case type, group, priority and confidentiality
- Intelligent routing on location, legal entity, language, sensitivity and lifecycle stage
- Now Assist summarisation, response recommendations and resolution notes
- Knowledge-driven self-service and AI-drafted knowledge articles
- Sensitive case detection with restricted groups and case-level access control
- Missing-information checks, fulfilment tasks, SLA escalation and audit trail
- Continuous improvement dashboard for HR leadership

04 Expected Outcomes

- Faster intake, triage and case resolution with less manual effort
- More accurate classification, routing and assignment decisions
- Improved employee experience and status transparency
- Higher self-service adoption and reduced HR agent workload
- Consistent communications and better knowledge utilisation
- Stronger handling of sensitive cases, privacy and compliance
- Improved SLA performance and leadership visibility
- Scalable framework extensible to further HR services

INITIAL SCOPE Payroll · Benefits · Leave · Employment letters · Personal data changes · Onboarding · Policy clarification

Smart Student Service Request Management

Lost & Found and campus services on ServiceNow

PROBLEM STATEMENT

Students rely on many campus services — bonafide certificates, ID card replacement, hostel requests, transport passes, library services and course-related requests. Today these are spread across different offices and handled through manual, paper-based forms with no visibility or tracking.

KEY SERVICENOW FEATURES

- Custom tables
- Catalog items
- Variables
- Record producers
- Approvals
- Flow Designer / Workflow
- Notifications
- SLA
- Service Portal
- Reports

STUDENT REQUIREMENTS

- Report a lost item
- Report a found item
- Upload photographs of the item
- Specify location, date and time
- Search available found items
- Submit a claim on a found item
- Track claim status end to end

EXPECTED OUTCOME

- Centralized Lost & Found platform
- Reduced manual effort
- Faster item recovery
- Complete visibility and tracking
- SLA-driven service delivery
- Improved student experience via self-service portal

Campus Asset & Equipment Maintenance System

ServiceNow Application Concept

SLA-DRIVEN

PROBLEM STATEMENT

Universities manage thousands of assets — computers, projectors, lab equipment, printers, AC units and networking devices. Poor tracking of failures and maintenance leads to costly downtime.

EXPECTED OUTCOME

A ServiceNow application that manages the full campus asset lifecycle — from student-reported faults to technician repair and closure, measured against SLAs.

REPORT-TO-RESOLVE FLOW

Create Incident → **Identify Asset** → **Identify Location** → **Assign Technician** → **SLA Clock** → **Repair** → **Close**

Example report: "Projector in Room 204 is not working."

APPLICATION FEATURES

- Asset database
- Incident management
- Maintenance requests
- Asset history
- Technician assignment
- Preventive maintenance
- SLA management
- Notifications
- Reports & dashboard
- Preventive scheduling

KEY SERVICENOW FEATURES

Service Catalog · Catalog Items · Variables · Record Producers · Approvals · Flow Designer · Notifications · SLA · Service Portal · Reports · Dashboards

Campus Lost & Found Management System

A ServiceNow application managing the complete lost-and-found lifecycle

PROBLEM STATEMENT

Phones, ID cards, wallets, books, laptops and keys go missing on campus every day, and today's lost-and-found process is manual, slow and inefficient — items go unclaimed and there is no audit trail.

EXPECTED OUTCOME

STUDENT CAN

- Report a lost item
- Report a found item
- Upload photographs
- Specify location, date & time
- Search available found items
- Submit a claim
- Track claim status

ADMINISTRATOR CAN

- Verify ownership
- Match lost & found records
- Approve / reject claims
- Maintain audit history
- Generate reports

SERVICENOW FEATURES

- Service Catalog
