KPMG

# Student Hackathon Program – 2026 Use Cases

SEP-2026

# 1. SME Finder, Mentorship & Community Network

## 1. Background

*Describe the business context and current process.*

Organizations often struggle to connect employees with the right Subject Matter Experts (SMEs), mentors, and professional communities. Employees frequently rely on personal networks, emails, or Teams messages to find guidance on technologies, projects, certifications, and career development. This process is time-consuming, inconsistent, and often results in missed learning and collaboration opportunities.

## 2. Objective

*State the measurable outcome to be achieved.*

Build an AI-enabled platform that helps employees discover SMEs, request mentorship, and engage with communities of practice. The solution will provide personalized expert recommendations, simplify mentor-mentee connections, and promote knowledge sharing across the organization, improving collaboration and continuous learning.

## 3. Business Problem

*Explain the pain points, impact and risks.*

There is no centralized platform for employees to identify experts, discover mentors, or participate in professional communities. Employees spend considerable time searching for guidance, while valuable expertise remains siloed within teams. This leads to slower problem resolution, reduced collaboration, duplicated efforts, and limited career development opportunities.

## 4. Solution Scope

*Define what teams should build and the boundaries.*

The solution will provide employees with a centralized platform to discover SMEs, connect with mentors, and participate in knowledge-sharing communities. AI-powered recommendations will help employees find relevant experts, mentors, and communities based on skills, certifications, interests, and project experience.

Employees can search for SMEs, submit mentorship requests, join communities for practice, and access shared knowledge resources. SMEs and mentors can manage expertise profiles and mentoring availability, while community leaders can drive engagement and collaboration.

Managers will have access to dashboards displaying mentorship activities, SME demand, community participation, and knowledge-sharing trends. Automated workflows will manage mentor requests, approvals, notifications, expert recommendations, and community onboarding.

The solution includes SME discovery, mentor matching, mentorship management, community collaboration, expertise profiles, and engagement analytics. Future enhancements may include AI career guidance, skill-based networking recommendations, and integration with learning and certification platforms.

## 5. ServiceNow Skills

# 2. UPSKILL – Learning, Mentorship & Skill Growth Platform

## 1. Background

*Describe the business context and current process.*

Organizations provide access to multiple learning platforms, certification programs, knowledge repositories, and internal experts. However, employees often struggle to identify the right learning path, discover relevant certifications, find mentors, or connect with Subject Matter Experts (SMEs). Learning resources are scattered across systems, resulting in fragmented learning experiences and slower skill development.

## 2. Objective

*State the measurable outcome to be achieved.*

Build UPSKILLI, a centralized AI-powered learning and career growth platform that helps employees assess their skills, identify knowledge gaps, discover learning paths, enroll in relevant courses, connect with SMEs and mentors, and achieve certification and career development goals through a personalized learning journey.

## 3. Business Problem

*Explain the pain points, impact and risks.*

Organizations lack a consolidated view of employee skills, certifications, learning progress, mentoring opportunities, and SME expertise. Employees spend significant time searching for learning resources and expert guidance, while managers struggle to identify skill gaps and workforce readiness. This results in slower upskilling, inconsistent career development, reduced knowledge sharing, and difficulty preparing employees for future roles and project demands.

## 4. Solution Scope

*Define what teams should build and the boundaries.*

The solution will provide employees with a centralized platform to assess skills, identify learning paths, enroll in courses, track certifications, connect with SMEs, request mentors, and participate in knowledge-sharing communities.

AI-powered recommendations will suggest learning content, certifications, mentors, and communities based on employee skills, interests, career goals, and role requirements. Managers will have access to dashboards displaying skill readiness, certification progress, learning adoption, mentoring activities, community engagement, and organizational skill gaps. Automated workflows will manage learning requests, mentor approvals, certification tracking, notifications, and progress updates.

The solution includes employee skill profiles, skill gap analysis, learning path recommendations, certification management, SME discovery, mentorship requests, and community collaboration. Future enhancements may include AI career coaching, internal gig matching, learning impact analytics, and integration with external learning platforms.

# 3. Talent Acquisition & Hiring Lifecycle Management

## 1. Background

*Describe the business context and current process.*

Organizations often struggle to manage end-to-end hiring activities across multiple systems, emails, and spreadsheets. Recruitment teams spend significant time coordinating job postings, candidate applications, interview scheduling, feedback collection, and hiring decisions. This fragmented process creates delays, reduces visibility into candidate progress, and impacts the overall candidate experience.

## 2. Objective

*State the measurable outcome to be achieved.*

Build an AI-enabled platform that helps recruiters and hiring managers manage the complete hiring lifecycle, from job requisition and candidate sourcing to interviews, offer management, and candidate selection. The solution will provide AI-powered candidate recommendations, streamline recruitment workflows, improve collaboration, and enhance hiring efficiency.

## 3. Business Problem

*Explain the pain points, impact and risks.*

There is no centralized platform to manage the complete recruitment journey. Recruiters often spend considerable time coordinating interviews, collecting feedback, tracking candidate status, and managing approvals. Candidate information is scattered across tools, leading to slower hiring cycles, poor visibility, inconsistent processes, delayed decision-making, and reduced candidate satisfaction.

## 4. Solution Scope

*Define what teams should build and the boundaries.*

The solution will provide recruiters and hiring managers with a centralized platform to create job requisitions, publish job openings, manage candidate applications, schedule interviews, collect interviewer feedback, and drive hiring decisions. AI-powered recommendations will help identify suitable candidates, assist in resume screening, and provide hiring insights.

Recruiters can track candidate progression through each stage of the recruitment lifecycle, while interviewers can manage schedules and submit evaluations through a unified interface. Hiring managers will have access to dashboards displaying open positions, hiring pipelines, interview outcomes, candidate status, and hiring metrics.

Automated workflows will manage requisition approvals, interview scheduling, candidate communications, feedback collection, offer approvals, and hiring decisions. The solution includes job posting management, candidate tracking, interview lifecycle management, candidate evaluation, offer management, and recruitment analytics. Future enhancements may include AI interview assistants, talent pool recommendations, and onboarding integration.

# 4. Library & Learning Resource Management System

## 1. Background

*Describe the business context and current process.*

Organizations invest in learning resources such as technical books, certification guides, training materials, and knowledge assets to support employee development. These resources are often managed manually through spreadsheets or disconnected systems, making it difficult to track availability, utilization, and borrowing history. Employees frequently struggle to locate relevant learning resources, while administrators spend significant effort managing inventories and monitoring returns.

## 2. Objective

*State the measurable outcome to be achieved.*

Build a centralized Learning Resource Management application on ServiceNow that enables employees to discover, reserve, borrow, and return learning resources. The solution will improve resource visibility, automate tracking and notifications, reduce administrative effort, and increase utilization of organizational learning assets.

## 3. Business Problem

*Explain the pain points, impact and risks.*

Learning resources are often managed through manual processes with limited visibility into availability and utilization. Employees spend time for resources, while administrators struggle to maintain accurate search engine inventory records and monitor overdue items. This results in underutilized assets, delayed returns, inventory inaccuracies, and increased operational overhead.

## 4. Solution Scope

*Define what teams should build and the boundaries.*

The solution will provide employees with a centralized platform to search, reserve, borrow, and return learning resources. AI-powered recommendations will suggest relevant books, certification guides, and training materials based on employee skills, interests, certifications, and learning goals.

Administrators will be able to manage inventories, track resource availability, monitor borrowing activity, and receive visibility into utilization trends. Automated workflows will handle reservations, issue and return processes, due-date reminders, overdue notifications, and resource availability updates.

The solution includes resource catalog management, reservation and borrowing workflows, inventory tracking, utilization reporting, and learning resource recommendations. Future enhancements may include QR/barcode scanning, LMS integration, and AI-driven learning path recommendations.

## 5. ServiceNow Skills

*List the platform capabilities expected in the solution.*

# 5. Absence Management Application

## 1. Background

*Describe the business context and current process.*

Organizations often manage employee leave requests through emails, spreadsheets, or multiple disconnected systems, creating inefficiencies for employees, managers, and HR teams. Employees struggle to track leave balances and request status, while managers lack visibility into team availability and overlapping absences. HR teams spend significant effort maintaining records, responding to queries, and ensuring policy compliance. A centralized absence management solution is needed to simplify leave administration and improve workforce planning.

## 2. Objective

*State the measurable outcome to be achieved.*

Build an AI-enabled ServiceNow application that allows employees to apply for leave, track request status, and view leave balances through a self-service interface. Enable managers to approve or reject requests from a consolidated team view and monitor team availability. Automate leave balance calculations, approvals, notifications, and reporting to reduce manual effort, improve transparency, and enhanced user experience.

## 3. Business Problem

*Explain the pain points, impact and risks.*

Current absence management processes are fragmented and heavily dependent on manual intervention. Employees often rely on HR for leave balance information and status updates, while managers review requests individually without insight into team-wide absences. This results in approval delays, leave conflicts, inaccurate leave records, and poor resource planning. If unresolved, these challenges can impact productivity, employee satisfaction, and delivery commitments.

## 4. Solution Scope

*Define what teams should build and the boundaries.*

The solution will provide employee self-service leave application, leave balance visibility, request tracking, and AI-assisted guidance for leave-related queries. Managers will have access to a dashboard displaying team leave schedules, pending approvals, and absence conflicts.

Automated workflows will handle approvals, notifications, reminders, and leave balance updates. Reporting capabilities will provide visibility into leave utilization, approval turnaround times, and workforce availability. Advanced integrations such as payroll, attendance systems, and external HR platforms are excluded from the initial scope.

Future enhancements may include predictive absence analytics, calendar integrations, and multi-level approvals.

## 5. ServiceNow Skills

*List the platform capabilities expected in the solution.*

# 6. Fitness & Wellness Management Platform

## 1. Background

*Describe the business context and current process.*

Organizations are increasingly investing in employee wellness programs, fitness centers, and health initiatives to improve employee wellbeing and engagement. However, gym memberships, trainer assignments, fitness programs, attendance, and wellness activities are often managed through spreadsheets or disconnected systems, resulting in limited visibility and administrative inefficiencies.

## 2. Objective

*State the measurable outcome to be achieved.*

Build a centralized Fitness & Wellness Management platform that enables employees to manage memberships, enroll in fitness programs, book trainers, track attendance, and participate in wellness initiatives. The solution will improve member engagement, streamline operations, and provide visibility into health and wellness program adoption.

## 3. Business Problem

*Explain the pain points, impact and risks.*

Organizations lack a unified platform to manage memberships, trainer schedules, attendance, and wellness activities. Manual tracking leads to inaccurate records, missed membership renewals, underutilized facilities, and limited insights into employee participation. This results in operational inefficiencies, poor member experience, and reduced effectiveness of wellness programs.

## 4. Solution Scope

*Define what teams should build and the boundaries.*

The solution will provide employees with a centralized platform to register for memberships, enroll in wellness programs, schedule trainer sessions, track attendance, and receive wellness recommendations. AI-powered suggestions can recommend fitness programs, trainers, and wellness activities based on employee interests, goals, and participation history.

Gym administrators and wellness teams will be able to manage memberships, monitor trainer utilization, track attendance, and oversee facility usage through real-time dashboards. Automated workflows will manage registrations, renewals, trainer assignments, attendance tracking, reminders, and wellness communications.

The solution includes membership management, attendance tracking, trainer scheduling, wellness program enrollment, engagement monitoring, and activity analytics. Future enhancements may include wearable device integration, personalized wellness coaching, fitness challenges, and AI-driven health insights.

## 5. ServiceNow Skills

# 7. Klick2Kart- E-Commerce Order & Customer Experience Management

## 1. Background

*Describe the business context and current process.*

Organizations operating e-commerce businesses manage large volumes of products, orders, shipments, returns, and customer inquiries. These activities are often spread across multiple systems, making it difficult to maintain inventory accuracy, provide real-time order visibility, and deliver a seamless customer experience. A centralized platform is needed to streamline order processing and improve operational efficiency.

## 2. Objective

*State the measurable outcome to be achieved.*

Build a centralized e-commerce management platform that enables customers to browse products, place orders, track deliveries, and manage returns while providing sellers and operations teams with end-to-end visibility into inventory, order fulfillment, and customer interactions. AI-powered recommendations and automation will improve customer experience and operational performance.

## 3. Business Problem

*Explain the pain points, impact and risks.*

Organizations face challenges managing inventory, order processing, shipment tracking, and customer support across disconnected systems. Limited visibility into order status and stock availability can result in fulfillment delays, inventory discrepancies, customer dissatisfaction, and revenue leakage. Manual handling of returns and order exceptions further increases operational overhead.

## 4. Solution Scope

*Define what teams should build and the boundaries.*

The solution will provide customers with a centralized platform to discover products, place orders, track deliveries, and initiate returns. AI-powered recommendations will suggest relevant products, promotions, and personalized offers based on customer preferences and purchase history.

Operations teams will be able to manage product catalogs, inventory, order fulfillment, shipment tracking, and return requests through a unified interface. Real-time dashboards will provide visibility into order status, inventory levels, fulfillment performance, returns, and customer trends.

Automated workflows will manage order processing, inventory validation, shipment updates, customer notifications, return approvals, and refund processing. The solution includes product catalog management, customer order lifecycle management, inventory tracking, shipment monitoring, return handling, and business analytics. Future enhancements may include demand forecasting, supplier integration, AI-powered customer support, and personalized shopping assistants.

## 5. ServiceNow Skills

# 8. KonnectFest - Digital Coupon & Event Commerce Management

## 1. Background

*Describe the business context and current process.*

Large events, college festivals, corporate gatherings, and food fairs often rely on physical coupons for purchasing food, games, merchandise, and event services. Managing printed coupons, vendor settlements, and redemption tracking manually leads to operational inefficiencies, lost revenue, and limited visibility into event performance.

## 2. Objective

*State the measurable outcome to be achieved.*

Build a centralized Digital Coupon & Event Commerce platform that enables organizers to create and distribute digital coupons, allows participants to make cashless purchases using QR-based coupons, and provides real-time visibility into coupon usage, vendor sales, and event transactions.

## 3. Business Problem

*Explain the pain points, impact and risks.*

Event organizers struggle with manual coupon distribution, redemption validation, vendor settlement, and usage tracking. Physical coupons can be lost, duplicated, or misused, while organizers have limited visibility into sales and vendor performance during events. Manual reconciliation after events is time-consuming and prone to errors, impacting operational efficiency and revenue tracking.

## 4. Solution Scope

*Define what teams should build and the boundaries.*

The solution will provide participants with a digital wallet to receive and use QR-based coupons for food, games, merchandise, and event activities. Vendors can scan and redeem coupons in real time, while organizers monitor coupon consumption, sales activity, vendor performance, and settlement information through centralized dashboards.

AI-powered insights can identify high-demand stalls, coupon usage trends, popular activities, and revenue patterns. Automated workflows will manage coupon creation, distribution, redemption validation, vendor onboarding, notifications, settlement calculations, and event reporting.

The solution includes digital coupon lifecycle management, QR-based redemption, vendor management, participant wallets, usage tracking, sales analytics, and reconciliation reporting. Future enhancements may include UPI payments, multi-event wallet support, loyalty programs, and AI-driven crowd and spending analytics.

## 5. ServiceNow Skills

# 9. CityKonnect - Smart Civic Issue Management System

## 1. Background

*Describe the business context and current process.*

Cities and municipalities receive a large number of citizen complaints related to roads, streetlights, sanitation, waste management, water supply, and public infrastructure. These complaints are often reported through multiple channels and managed manually, resulting in fragmented tracking, delayed responses, and limited visibility into issue resolution.

## 2. Objective

*State the measurable outcome to be achieved.*

Build a centralized Smart Civic Issue Management platform that enables citizens to report civic issues, track resolution status, and provide feedback, while helping municipal authorities streamline issue assignment, monitoring, and resolution through automated workflows and AI-powered insights.

## 3. Business Problem

*Explain the pain points, impact and risks.*

Municipal authorities often struggle with manual complaint handling, delayed routing, duplicate issue reporting, and lack of end-to-end visibility into issue resolution. Limited tracking and coordination across departments lead to slower response times, operational inefficiencies, and reduced citizen satisfaction.

## 4. Solution Scope

*Define what teams should build and the boundaries.*

The solution will provide citizens with a centralized platform to report civic issues by submitting descriptions, photos, and location details. AI-powered capabilities can automatically categorize complaints, identify duplicate issues, determine priority levels, and recommend the appropriate department for resolution.

Municipal teams will be able to manage complaint assignments, monitor field activities, track issue progress, and communicate status updates to citizens through a unified interface. Real-time dashboards will provide visibility into complaint volumes, resolution timelines, department performance, recurring problem areas, and citizen feedback.

Automated workflows will manage issue routing, escalations, work order creation, notifications, approvals, and closure processes. The solution includes issue reporting, geo-tagging, case management, department assignment, citizen communication, performance monitoring, and analytics. Future enhancements may include predictive infrastructure maintenance, IoT integrations, chatbot-based issue reporting, and AI-driven resource allocation.

## 5. ServiceNow Skills

*List the platform capabilities expected in the solution.*

# 10. SmartFlow : Smart Traffic Incident Management System

## 1. Background

*Describe the business context and current process.*

Urban traffic authorities receive reports related to accidents, road blockages, signal failures, congestion, and public safety incidents from multiple sources such as citizens, traffic personnel, surveillance systems, and monitoring centers. Managing these incidents through disconnected channels often results in delayed response, poor coordination, and limited visibility into traffic conditions and resolution progress.

## 2. Objective

*State the measurable outcome to be achieved.*

Build a centralized Smart Traffic Incident Management platform that enables traffic authorities to detect, prioritize, assign, track, and resolve traffic incidents in real time. The solution will improve coordination between departments, enhance visibility into active incidents, and support faster response and resolution.

## 3. Business Problem

*Explain the pain points, impact and risks.*

Traffic incident management is often handled manually, requiring coordination between multiple agencies such as traffic police, emergency services, municipal departments, and maintenance teams. Lack of centralized tracking leads to delayed response times, duplicate incident reporting, inefficient resource allocation, and limited visibility into traffic disruption patterns, impacting commuter experience and public safety.

## 4. Solution Scope

*Define what teams should build and the boundaries.*

The solution will provide a centralized platform for reporting, monitoring, and resolving traffic incidents. AI-powered capabilities can automatically categorize incidents, determine severity levels, identify impacted locations, detect duplicate reports, and recommend the appropriate response team.

Traffic authorities and operational teams will be able to manage incident assignments, track response progress, monitor SLA compliance, and coordinate activities across departments through a unified interface. Real-time dashboards will provide visibility into active incidents, traffic hotspots, response times, resolution trends, and department performance.

Automated workflows will manage incident routing, task assignments, escalations, notifications, approvals, and closure processes. The solution includes traffic incident reporting, geo-location tracking, case management, department coordination, public notifications, operational analytics, and performance monitoring. Future enhancements may include IoT traffic sensor integration, CCTV-based incident detection, AI-driven traffic prediction, and smart city integrations.

## 5. ServiceNow Skills

# 11. Online Student & Employee Representative Election Management

## 1. Background

*Describe the business context and current process.*

Educational institutions and organizations conduct elections for student presidents, student councils, employee representatives, labor unions, and committee leadership positions. Traditional voting processes often require physical presence, manual verification, paper ballots, and extensive administrative effort, making participation difficult for individuals who are remote, traveling, or working across locations.

## 2. Objective

*State the measurable outcome to be achieved.*

Build a secure online election platform that enables eligible voters to participate in elections from anywhere, manage candidate nominations, conduct digital voting, automate vote counting, and generate transparent election results while ensuring fairness, security, and compliance with election rules.

## 3. Business Problem

*Explain the pain points, impact and risks.*

Manual election processes often result in low voter participation, lengthy verification procedures, delayed result announcements, and significant operational overhead. Organizations face challenges ensuring voter eligibility, preventing duplicate voting, maintaining election transparency, and providing real-time visibility into election progress. These challenges can impact trust, engagement, and the overall effectiveness of the election process.

## 4. Solution Scope

*Define what teams should build and the boundaries.*

The solution will provide a centralized platform for managing the complete election lifecycle, including candidate nominations, voter registration, eligibility validation, digital voting, vote counting, and result publication. AI-powered capabilities can assist with voter eligibility verification, anomaly detection, duplicate voting prevention, and election participation analytics.

Election administrators will be able to manage election schedules, candidate profiles, voter lists, voting windows, approvals, and result declarations through a unified interface. Real-time dashboards will provide visibility into voter turnout, participation trends, candidate statistics, and election progress.

Automated workflows will manage nomination approvals, voter verification, voting access, notifications, result generation, and audit tracking. The solution includes election management, candidate registration, secure online voting, automated vote counting, result publishing, and election analytics. Future enhancements may include biometric verification, mobile voting, blockchain-based audit trails, and AI-driven voter engagement insights.

## 5. ServiceNow Skills

# 12. Timesheet Management Application

## 1. Background

*Describe the business context and current process.*

Many organizations require employees to submit timesheets for payroll processing, project billing, utilization tracking, and compliance purposes. In several cases, timesheets are maintained in spreadsheets or separate tools, requiring employees to manually record hours and managers to follow up on submissions. This creates administrative overhead and delays in payroll and reporting processes. A centralized ServiceNow-based timesheet application can simplify time entry, approvals, and tracking while improving accuracy and compliance.

## 2. Objective

*State the measurable outcome to be achieved.*

Build a simple AI-enabled ServiceNow application that allows employees to record daily or weekly work hours, submit timesheets for approval, track submission status, and maintain compliance with payroll requirements. Managers should have visibility into pending submissions and approvals, while HR and Finance teams can access timesheet data for payroll processing and reporting..

## 3. Business Problem

*Explain the pain points, impact and risks.*

Employees often forget to submit timesheets on time, resulting in delayed payroll processing and inaccurate effort tracking. Managers spend significant time following up on missing timesheets and validating manually entered data. Limited visibility into submission status and employee utilization creates reporting challenges and increases administrative effort. These inefficiencies can impact payroll accuracy, project billing, and workforce planning.

## 4. Solution Scope

*Define what teams should build and the boundaries.*

The solution will provide timesheet entry, submission, approval, and tracking capabilities through a self-service portal. Employees can log hours against projects, activities, or work categories and view submission history. Managers can review, approve, or reject submitted timesheets and monitor compliance across their teams. Automated reminders and notifications will ensure timely submissions.

Dashboards and reports will provide insights into timesheet compliance, utilization, and approval turnaround times. Future enhancements may leverage AI to pre-fill timesheets, recommend hours based on calendar activities, and identify anomalies in submitted effort.

## 5. ServiceNow Skills

*List the platform capabilities expected in the solution.*

# 13. Global Mobility App

## 1. Background

*Describe the business context and current process.*

Organizations with global delivery models frequently move employees across countries for client engagements, project deployments, business meetings, training programs, and long-term assignments. Employees often face challenges understanding visa requirements, travel documentation, immigration processes, compliance obligations, and relocation support. HR, Mobility, and Travel teams spend considerable effort managing requests, validating documentation, tracking approvals, and responding to repetitive employee queries.

## 2. Objective

*State the measurable outcome to be achieved.*

Build a centralized AI-powered Global Mobility application on ServiceNow that streamlines employee mobility processes, including visa requests, immigration support, travel readiness, document management, approvals, and status tracking. The solution should provide employees with a single platform to manage international travel and relocation needs while giving HR and Mobility teams end-to-end visibility.

## 3. Business Problem

*Explain the pain points, impact and risks.*

Global mobility processes are often fragmented across emails, spreadsheets, travel vendors, and HR teams. Employees may submit incomplete documentation, miss important deadlines, or lack awareness of country-specific requirements. Mobility teams spend significant time coordinating approvals, verifying compliance, and providing status updates. Delays in visa processing and travel readiness can impact project staffing, client commitments, and overall business operations.

## 4. Solution Scope

*Define what teams should build and the boundaries.*

The application will provide a self-service portal where employees can initiate international travel or relocation requests, view country-specific requirements, upload supporting documents, track approval workflows, and monitor application status. Managers, HR, and Mobility teams will be able to review requests, validate documentation, monitor travel readiness, and manage compliance obligations through centralized dashboards.

AI capabilities will assist employees with personalized guidance, document recommendations, visa eligibility information, and travel readiness assessments.

# 14. Student Assignment Management System

## 1. Background

*Describe the business context and current process.*

Educational institutions manage assignments, coursework, project submissions, and grading activities for students across multiple subjects and semesters. Assignment tracking is often spread across emails, spreadsheets, learning portals, and manual processes, making it difficult for students and faculty to manage deadlines, submissions, feedback, and academic progress effectively.

## 2. Objective

*State the measurable outcome to be achieved.*

Build a centralized Student Assignment Management platform that enables faculty to create and manage assignments, allows students to submit coursework digitally, and provides real-time visibility into assignment status, deadlines, submissions, grading, and feedback.

## 3. Business Problem

*Explain the pain points, impact and risks.*

Educational institutions often face challenges in tracking assignment submissions, monitoring pending work, collecting feedback, and ensuring timely completion of coursework. Students may miss deadlines due to lack of visibility, while faculty spend significant effort tracking submissions and coordinating follow-ups. This results in delayed evaluations, increased administrative overhead, and limited visibility into student performance.

## 4. Solution Scope

*Define what teams should build and the boundaries.*

The solution will provide students and faculty with a centralized platform to create, assign, submit, review, and manage academic assignments. AI-powered capabilities can recommend study resources, identify submission trends, flag potential overdue assignments, and provide insights into student engagement.

Faculty can create assignments, define due dates, track submissions, evaluate coursework, and provide feedback through a unified interface. Students can access assignments, receive reminders, submit work, track grades, and view faculty feedback.

Real-time dashboards will provide visibility into assignment completion rates, pending submissions, grading status, student participation, and academic performance. Automated workflows will manage assignment publication, notifications, submission tracking, reminders, grading updates, feedback sharing, and overdue escalations.

The solution includes assignment creation, digital submissions, grading management, feedback collection, deadline tracking, student progress monitoring, and academic analytics. Future enhancements may include plagiarism detection, LMS integration, AI-based grading assistance, and personalized learning recommendations.

# 15. Lost & Found Items with AI Matching

## 1. Background

*Describe the business context and current process.*

Educational institutions and large campuses frequently handle lost belongings such as ID cards, laptops, wallets, books, and accessories. Reports are usually shared through emails, security desks, or spreadsheets, making it difficult to connect found items with existing lost-item reports. Administrators manually compare descriptions, locations, and dates, while users have limited visibility into the status of their claims. A centralized application can standardize reporting, matching, custody tracking, and return of items.

## 2. Objective

*State the measurable outcome to be achieved.*

Build an AI-enabled ServiceNow application that manages the end-to-end lost-and-found lifecycle. Users should be able to report lost items, submit found-item reports, and upload supporting images. The platform should recommend likely matches using category, description, color, brand, date, and location. The solution should notify relevant users, support ownership verification, maintain a complete audit trail, and improve recovery visibility through dashboards.

## 3. Business Problem

*Explain the pain points, impact and risks.*

Manual and fragmented processes delay identification and return of recovered belongings. Similar reports can be overlooked because wording, item details, and locations vary. Users repeatedly contact support teams for updates, while administrators spend time reviewing records and validating ownership. Weak custody tracking can create disputes, security concerns, and privacy risks, particularly for identity cards and electronic devices. Without a consistent workflow, institutions cannot measure recovery rates, aging items, recurring loss locations, or operational workload.

## 4. Solution Scope

*Define what teams should build and the boundaries.*

The solution will provide self-service forms for lost and found reports, image attachments, item categories, last-seen or discovery locations, and custody details. An AI-assisted matching service will compare open records and generate a confidence-ranked list of possible matches.

Flow Designer will trigger notifications, administrator review, claim verification, approval, and handover tasks. A workspace will support match review, inventory management, and chain-of-custody tracking.

Dashboards will show open reports, potential matches, recovered items, aging inventory, and frequently reported categories or locations. Advanced external integrations, biometric verification, and production-grade computer vision are excluded from the initial scope and may be considered future enhancements.

## 5. ServiceNow Skills

*List the platform capabilities expected in the solution.*

- App Engine Studio and scoped application
- Custom tables, forms, and data relationships
- Flow Designer, approvals, and task routing
- Business Rules and notifications
- UI Builder / Employee Center experience
- Workspace for administrator operations
- Dashboards and reporting
- Generative AI or similarity-based matching
- Optional: Virtual Agent, QR codes, and mobile experience

# 16. Parking Management for Smart Campuses and Corporate Offices

## 1. Background

*Describe the business context and current process.*

Organizations operating large campuses and corporate offices often face challenges managing limited parking spaces, visitor parking requests, and daily vehicle access. Most parking allocation processes rely on manual approvals, first-come-first-served bookings, or security-managed assignments, resulting in poor utilization, employee dissatisfaction, and operational inefficiencies.

## 2. Objective

*State the measurable outcome to be achieved.*

Build an AI-powered Smart Parking Management solution that automates parking reservations, slot allocation, visitor parking requests, and occupancy tracking. The solution will provide employees and visitors with a seamless parking experience while enabling facilities and security teams to optimize parking utilization and reduce administrative effort.

## 3. Business Problem

*Explain the pain points, impact and risks.*

Parking spaces are often managed through manual processes with limited visibility into real-time availability and demand. Employees spend valuable time searching for parking, visitors face unclear parking procedures, and facilities teams struggle to balance parking capacity with usage trends. This results in parking congestion, inefficient space utilization, poor employee experience, and increased operational overhead.

## 4. Solution Scope

*Define what teams should build and the boundaries.*

The solution will provide employees and visitors with a centralized platform to reserve parking spaces, request visitor parking, view availability, and receive real-time parking guidance. AI-powered allocation will automatically assign the most suitable parking slot based on availability, priority rules, location preferences, and occupancy patterns.

Facilities and security teams will have access to dashboards displaying parking utilization, occupancy trends, visitor parking requests, waitlists, and demand forecasts. Automated workflows will manage parking reservations, approvals, slot assignments, visitor access requests, notifications, and parking release processes.

The solution includes employee parking reservations, visitor parking management, automated slot allocation, occupancy monitoring, utilization analytics, and reporting. Future enhancements may include license plate recognition, IoT sensor integration, smart barrier automation, EV charging station reservations, and predictive parking demand analytics.

## 5. ServiceNow Skills

*List the platform capabilities expected in the solution.*

- App Engine Studio
- Service Catalog
- Flow Designer
- Business Rules
- Notifications and Email Integrations
- UI Builder
- Employee Center
- Dashboards and Reporting
- Generative & Agentic AI capabilities

# 17. Corporate Social Responsibility (CSR) Management

## 1. Background

*Describe the business context and current process.*

Organizations invest in Corporate Social Responsibility (CSR) initiatives to support community welfare, environmental sustainability, education, healthcare, and social development programs. These initiatives are often executed in partnership with NGOs, non-profit organizations, and external service providers. Managing CSR activities, partner organizations, employee participation, volunteer hours, CSR targets, and impact metrics through spreadsheets and emails leads to fragmented data, limited governance, and challenges in measuring outcomes.

## 2. Objective

*State the measurable outcome to be achieved.*

Build a centralized ORG CSR Management solution that enables organizations to onboard and manage CSR partner organizations, create CSR initiatives and campaigns, register employees for volunteering activities, track CSR participation hours, monitor CSR budgets and annual targets, and measure social impact through real-time dashboards and analytics.

## 3. Business Problem

*Explain the pain points, impact and risks.*

Organizations lack a unified platform to govern CSR programs across multiple NGO partners and volunteering initiatives. CSR activities are often managed manually, making it difficult to track partner engagement, employee contributions, volunteer hours, CSR spending, beneficiary reach, and target achievement. This results in limited transparency, inefficient reporting, compliance challenges, and reduced ability to measure the effectiveness of CSR investments.

## 4. Solution Scope

*Define what teams should build and the boundaries.*

The solution will provide a centralized CSR governance platform with the following capabilities:

CSR Partner Organization Management - Register and onboard NGO/CSR partner organizations & Maintain partner profiles, certifications, compliance documents, and contacts. Track organization-wise CSR projects and collaborations

Program Management - Create CSR campaigns, initiatives, and volunteering events, Define event objectives, beneficiaries, budgets, and target outcomes & Publish CSR opportunities for employee participation

Employee Participation Management - Allow employees to browse and register for CSR activities, Capture attendance and participation status, Track volunteer hours contributed by employees, Maintain organization-wide CSR contribution records & Issue participation certificates and recognition badges

CSR Target & Budget Management - Define annual CSR goals and targets, Track Target CSR Hours, Actual CSR Hours, Participation Targets, NGO Engagement Targets, Beneficiaries Impacted, CSR Spend vs Budget, Monitor progress against organizational CSR commitments

## 5. ServiceNow Skills

*List the platform capabilities expected in the solution.*

- App Engine Studio
- Service Catalog
- Flow Designer
- Business Rules
- Notifications and Email Integrations
- UI Builder
- Employee Center
- Dashboards and Reporting
- Generative & Agentic AI capabilities

# 18. Smart EV Charging Station Management Platform

## 1. Background

*Describe the business context and current process.*

The growing adoption of electric vehicles (EVs) has increased the demand for accessible and efficient charging infrastructure. EV users often struggle to identify nearby charging stations, verify charger availability, compare charging facilities, and reserve charging slots in advance. Charging station operators also lack a centralized platform to manage charging units, reservations, payments, and customer engagement.

## 2. Objective

*State the measurable outcome to be achieved.*

Build a centralized EV Charging Management platform that enables charging station operators to register and manage charging facilities, while allowing EV users to discover nearby charging stations, check real-time charger availability, reserve charging slots, and make online payments for charging services.

## 3. Business Problem

*Explain the pain points, impact and risks.*

EV users face challenges locating available charging stations, understanding charger compatibility, verifying operational status, and securing charging slots during peak demand periods. Charging station operators have limited visibility into charger utilization, reservation management, and customer demand patterns, resulting in inefficient resource utilization and poor customer experience.

## 4. Solution Scope

*Define what teams should build and the boundaries.*

The solution will provide charging station operators with a centralized platform to register charging facilities, manage charging units, publish charger specifications, update amenities, and maintain charging station information. Users can search for nearby charging stations based on their current location, view real-time charger availability, charging unit status, manufacturer details, charging types, facilities offered, ratings, and estimated travel time to the charging station.

Google Maps integration will help users view the distance and estimated travel duration from their current location to available charging stations. Users can compare charging stations, select a preferred vendor, and reserve an available charging slot. Once a charging slot is reserved, the system will automatically update charger availability and prevent double booking.

Automated workflows will manage charger reservations, booking confirmations, availability updates, notifications, and payment processing. The solution includes vendor onboarding, charging station management, charger availability tracking, reservation management, location services, ratings and reviews, and operational analytics. Future enhancements may include real-time charging session monitoring, dynamic pricing, EV route planning, membership programs, UPI integration, and charging demand prediction.

## 5. ServiceNow Skills

*List the platform capabilities expected in the solution.*

- App Engine Studio
- Service Catalog
- Flow Designer
- Business Rules
- Notifications and Email Integrations
- UI Builder
- Employee Center
- Dashboards and Reporting
- Generative & Agentic AI capabilities

# 19. SmartPrep – Intelligent Study Assistant

## 1. Background

*Describe the business context and current process.*

Students often spend significant time preparing for exams by reading textbooks, notes, and study materials while manually creating revision plans and practice questions. Traditional study methods lack personalization, making it difficult for students to assess their understanding, identify knowledge gaps, and effectively prepare for examinations.

## 2. Objective

*State the measurable outcome to be achieved.*

Build an AI-powered SmartPrep platform that enables students to scan chapters, notes, or study materials and automatically generate personalized assessments, quizzes, multiple-choice questions (MCQs), and revision exercises to support effective learning and exam preparation.

## 3. Business Problem

*Explain the pain points, impact and risks.*

Students often struggle to evaluate their understanding of study material and prepare efficiently for examinations. Creating practice questions manually is time-consuming, while access to quality assessment content is limited. This can result in poor retention, ineffective revision, and difficulty identifying weaker areas before exams.

## 4. Solution Scope

*Define what teams should build and the boundaries.*

The solution will provide students with a centralized platform to upload or scan textbook chapters, notes, and learning materials. AI-powered capabilities will analyze the content and automatically generate MCQs, short-answer questions, quizzes, flashcards, mock assessments, and revision exercises tailored to the uploaded material.

Students can attempt assessments, receive instant feedback, track performance, identify weak topics, and access AI-generated study recommendations. Educators can upload learning content, review assessments, monitor student progress, and analyze learning outcomes through dashboards and reports.

Automated workflows will manage content processing, assessment generation, progress tracking, notifications, and performance reporting. The solution includes content scanning, AI-based question generation, assessment management, performance analytics, learning recommendations, and progress monitoring. Future enhancements may include adaptive learning paths, multilingual support, voice-based learning assistance, and AI-powered exam preparation coaching.

## 5. ServiceNow Skills

*List the platform capabilities expected in the solution.*

- App Engine Studio
- Service Catalog
- Flow Designer
- Business Rules
- Notifications and Email Integrations
- UI Builder
- Employee Center
- Dashboards and Reporting
- Generative & Agentic AI capabilities

# 20. Smart Transport & Cab Management Platform

## 1. Background

*Describe the business context and current process.*

Organizations providing employee transportation services often face challenges in managing cab bookings, route planning, seat allocation, vehicle utilization, and employee transportation requests. Employees have limited visibility into cab availability, schedules, live vehicle status, and route information, while transport teams struggle to optimize routes and handle transportation-related issues efficiently.

## 2. Objective

*State the measurable outcome to be achieved.*

Build a centralized Smart Transport & Cab Management platform that enables employees to book transportation services, track cab availability, monitor vehicle movements, and raise transportation-related requests while enabling transport administrators to optimize routes, manage fleet utilization, and improve employee commute experience.

## 3. Business Problem

*Explain the pain points, impact and risks.*

Transportation operations are frequently managed through manual processes, emails, or multiple disconnected systems, resulting in inefficient route planning, underutilized vehicles, overbooking, limited seat visibility, and poor user experience. Transport teams lack real-time insights into fleet utilization, employee demand patterns, and service quality, leading to increased operational costs and inefficiencies.

## 4. Solution Scope

*Define what teams should build and the boundaries.*

The solution will provide employees with a self-service platform to register for transport services by specifying pickup/drop locations and shift timings. The system will automatically assign employees to suitable routes and enable cab seat booking, trip tracking, and transportation request management.

Transport administrators can manage routes, vehicles, drivers, and seat allocations through a centralized dashboard. AI-powered capabilities can optimize routes, improve vehicle utilization, forecast transport demand, and recommend efficient pickup points.

Automated workflows will handle employee onboarding, route assignments, seat bookings, notifications, complaints, lost-item reporting, and transport analytics. Future enhancements may include GPS integration, ride-sharing recommendations, and dynamic route optimization.

## 5. ServiceNow Skills

*List the platform capabilities expected in the solution.*

- App Engine Studio
- Service Catalog
- Flow Designer
- Business Rules
- Notifications and Email Integrations
- UI Builder
- Employee Center
- Dashboards and Reporting
- Now Mobile App
- Generative & Agentic AI capabilities

# 21. Research Grant & Funding Management Platform

## 1. Background

*Describe the business context and current process.*

Research institutions and organizations manage multiple funding opportunities, grant applications, contracts, compliance requirements, and post-award activities across different departments and funding agencies. These processes are often fragmented, resulting in significant administrative effort, delayed approvals, and limited visibility into funding performance and outcomes.

## 2. Objective

*State the measurable outcome to be achieved.*

Build a centralized Research Grant & Funding Management platform that streamlines the complete grant lifecycle, from opportunity identification and proposal preparation to award management, compliance tracking, contract administration, and impact assessment.

## 3. Business Problem

*Explain the pain points, impact and risks.*

Managing research grants involves multiple stakeholders, funding agencies, compliance requirements, budgets, contracts, and reporting obligations. Manual processes increase administrative overhead, delay funding submissions, reduce visibility into grant performance, and limit an organization's ability to maximize funding opportunities and cost recovery.

## 4. Solution Scope

*Define what teams should build and the boundaries.*

The solution will provide researchers and administrators with a centralized platform to manage grant applications, funding opportunities, budgets, approvals, contracts, compliance requirements, and reporting activities. Users can prepare and submit grant applications, manage funding agency interactions, track award notifications, negotiate terms and conditions, and monitor project progress throughout the grant lifecycle.

Research administration teams will be able to manage post-award activities, funding utilization, contract execution, reporting obligations, and project closeout activities through a unified interface. Real-time dashboards will provide visibility into funding pipelines, grant status, awards, compliance milestones, budgets, project outcomes, and research impact.

Automated workflows will manage grant submissions, approvals, compliance reviews, budget validations, contract negotiations, post-award tracking, reporting requirements, and closeout processes. Future enhancements may include AI-assisted proposal reviews, funding opportunity recommendations, compliance monitoring, and research impact analytics.

## 5. ServiceNow Skills

*List the platform capabilities expected in the solution.*

- App Engine Studio
- Service Catalog
- Flow Designer
- Business Rules
- Notifications and Email Integrations

# 22. Community Disaster Response & Relief Management Portal

## 1. Background

*Describe the business context and current process.*

Natural disasters such as floods, earthquakes, cyclones, and wildfires create significant challenges in coordinating volunteers, managing relief materials, allocating resources, and supporting affected communities. Relief efforts are often managed through multiple channels, leading to delays, resource shortages, and limited visibility into ongoing operations.

## 2. Objective

*State the measurable outcome to be achieved.*

Build a centralized Disaster Response Management platform that enables volunteers, NGOs, government agencies, and communities to collaborate efficiently during emergencies, ensuring faster relief coordination, resource allocation, and support for affected individuals.

## 3. Business Problem

*Explain the pain points, impact and risks.*

Disaster response activities are often fragmented across organizations, making it difficult to track volunteers, manage relief requests, monitor shelter occupancy, and distribute resources effectively. This results in delayed response times, inefficient resource utilization, and reduced visibility into relief operations.

## 4. Solution Scope

*Define what teams should build and the boundaries.*

The solution will provide a centralized platform for volunteer registration, relief material requests, shelter management, and emergency assistance coordination. Volunteers can register their availability and skills, while affected communities can raise requests for food, medical aid, shelter, and essential supplies.

Relief coordinators can manage shelters, allocate resources, assign volunteers, track inventory, and monitor relief operations through a unified interface. Real-time dashboards will provide visibility into active requests, shelter occupancy, volunteer availability, resource distribution, and overall disaster response progress.

Automated workflows will manage request routing, volunteer assignments, material distribution, notifications, escalations, and emergency communication. Future enhancements may include GIS mapping, weather alerts, emergency mobile applications, and AI-based resource prioritization.

## 5. ServiceNow Skills

*List the platform capabilities expected in the solution.*

- App Engine Studio
- Service Catalog
- Flow Designer
- Business Rules
- Notifications and Email Integrations
- UI Builder
- Employee Center
- Dashboards and Reporting

# 23. Employee Mental Wellness & Support Platform

## 1. Background

*Describe the business context and current process.*

Employee wellbeing plays a critical role in productivity, engagement, and retention. However, many employees hesitate to seek mental health support due to stigma, privacy concerns, or lack of awareness about available wellness resources. Organizations need a safe and accessible platform to promote mental wellbeing and provide timely support.

## 2. Objective

*State the measurable outcome to be achieved.*

Build a centralized Employee Mental Wellness platform that enables employees to access confidential support services, schedule wellness sessions, seek assistance, and engage with organizational wellness programs through a secure and employee-friendly experience.

## 3. Business Problem

*Explain the pain points, impact and risks.*

Organizations often lack a structured mechanism to identify wellbeing concerns, facilitate access to support services, and measure wellness program effectiveness. Employees may delay seeking help, leading to increased stress, burnout, absenteeism, and reduced workplace engagement.

## 4. Solution Scope

*Define what teams should build and the boundaries.*

The solution will provide employees with a secure platform to raise anonymous wellness requests, schedule counseling sessions, access wellbeing resources, and participate in wellness initiatives. AI-powered capabilities can recommend relevant support resources, wellness content, and self-help guidance based on employee needs.

Wellness teams and HR administrators can manage appointments, support requests, escalations, and wellness programs through a centralized interface. Real-time dashboards will provide visibility into wellness program adoption, support request trends, appointment utilization, and organizational wellbeing metrics.

Automated workflows will manage appointment scheduling, request routing, confidential escalations, reminders, follow-ups, and wellness communications.

## 5. ServiceNow Skills

*List the platform capabilities expected in the solution.*

- App Engine Studio
- Service Catalog
- Flow Designer
- Business Rules
- Notifications and Email Integrations
- UI Builder
- Employee Center
- Dashboards and Reporting
- Generative & Agentic AI capabilities

# 24. Hospital Bed & Ward Occupancy Management System

## 1. Background

*Describe the business context and current process.*

Hospitals must efficiently manage bed availability, ward occupancy, patient admissions, transfers, and discharges to ensure optimal utilization of healthcare resources. Manual tracking often results in delayed admissions, bed shortages, inefficient ward allocation, and limited visibility into hospital capacity.

## 2. Objective

*State the measurable outcome to be achieved.*

Build a centralized Hospital Bed & Ward Occupancy Management platform that provides real-time visibility into bed availability, streamlines patient allocation, optimizes ward utilization, and improves operational efficiency across hospital departments.

## 3. Business Problem

*Explain the pain points, impact and risks.*

Hospital administrators often lack real-time visibility into bed occupancy, patient movement, and ward utilization. Manual coordination between admission teams, nursing staff, and ward administrators can lead to delays in patient placement, underutilized capacity, and operational inefficiencies.

## 4. Solution Scope

*Define what teams should build and the boundaries.*

The solution will provide hospital administrators with a centralized platform to manage bed inventory, ward allocations, patient admissions, transfers, and discharges. Staff can view real-time bed availability, occupancy status, ward capacity, and patient movement across the hospital through a unified interface.

AI-powered capabilities can recommend optimal bed assignments, predict discharge readiness, identify occupancy bottlenecks, and forecast bed demand. Real-time dashboards will provide visibility into ward occupancy, bed utilization, patient flow, admission queues, and capacity trends.

Automated workflows will manage bed requests, patient transfers, occupancy updates, discharge processing, notifications, and escalation handling. Future enhancements may include EHR integration, IoT-enabled bed monitoring, and predictive capacity planning.

## 5. ServiceNow Skills

*List the platform capabilities expected in the solution.*

- App Engine Studio
- Service Catalog
- Flow Designer
- Business Rules
- Notifications and Email Integrations
- UI Builder
- Employee Center

# 25. Financial & Cyber Fraud Investigation Hub

## 1. Background

*Describe the business context and current process.*

Financial institutions, enterprises, and regulatory teams face increasing incidents of financial fraud, cyber-enabled scams, payment fraud, identity theft, phishing attacks, money laundering, and unauthorized transactions. Investigation activities are often managed through emails, spreadsheets, and disconnected systems, resulting in delayed investigations, fragmented evidence, and limited visibility into case progress.

## 2. Objective

*State the measurable outcome to be achieved.*

Build a centralized Fraud Investigation Management platform that enables organizations to detect, investigate, manage, and resolve financial and cyber fraud cases through structured workflows, evidence management, and real-time investigation tracking.

## 3. Business Problem

*Explain the pain points, impact and risks.*

Fraud investigations involve multiple stakeholders, evidence sources, compliance requirements, and reporting obligations. Manual case handling makes it difficult to track investigations, maintain audit trails, manage evidence, monitor escalations, and ensure timely resolution. This increases operational risk, investigation time, and compliance challenges.

## 4. Solution Scope

*Define what teams should build and the boundaries.*

The solution will provide investigators with a centralized platform to create fraud cases, collect and manage evidence, track investigation activities, assign tasks, and monitor case progress. Fraud analysts can investigate suspicious transactions, cyber fraud incidents, phishing cases, account compromise events, and financial crime activities through a unified interface.

AI-powered capabilities can identify investigation patterns, detect potential fraud risks, prioritize cases, highlight related incidents, and recommend investigation actions. Real-time dashboards will provide visibility into open investigations, fraud trends, case severity, resolution timelines, financial exposure, and investigation outcomes.

Automated workflows will manage case intake, evidence collection, task assignments, escalations, approvals, compliance reviews, regulatory reporting, and case closure. Future enhancements may include fraud detection integrations, AML monitoring, threat intelligence feeds, and AI-driven fraud risk scoring.

## 5. ServiceNow Skills

*List the platform capabilities expected in the solution.*
